## Ethics in science

An incomplete account with practical consequences

Robert Schlögl

Bundesministerium

für Bildung

und Forschung

WWW. cec.mpg.de

WWW. fhi-berlin.mpg.de

- Science is no sports!
  - Speed is a minor parameter (limits of doctoral time periods in your interest!)
  - Correctness and originality are crucial
  - Responsibility for resources lies with you when planning and executing work.

www.

cec.mpa.de

- We do not do science to produce publications.
- Science is also no soap opera!
- We do science to learn and understand.
- We publish to document and to induce discussion.

**ÎÎÎÎÎ**Î unicat

- The use of publications and their citations are secondary quality metrices! We should not work for rankings!!
- First come correctness and originality.

BasCat

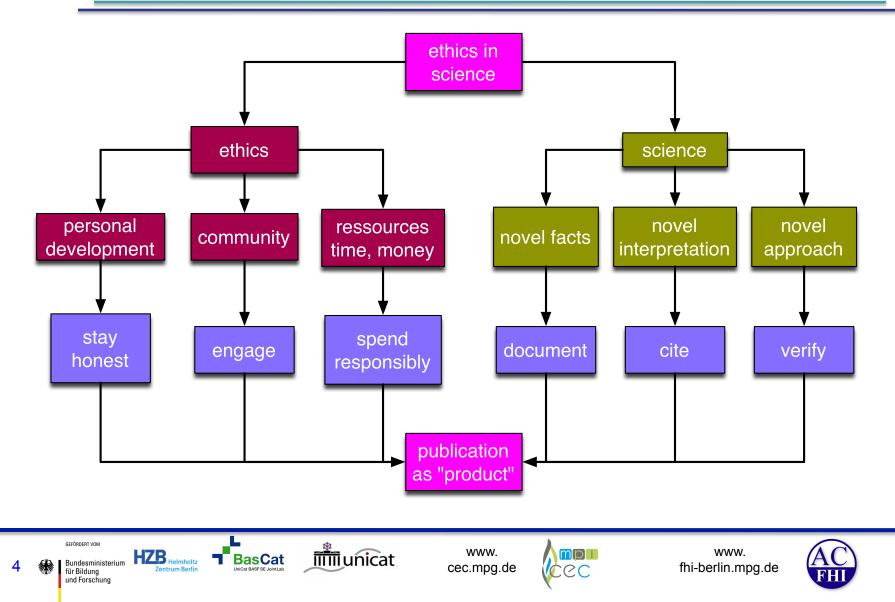

HZB

#### The imperative!

- German science ethics requires proof for the following:
- Data base of experiments (original data, experiment, plausibility) 10 years of documentation.
- Authorship (only and exclusively contributors, gray lines for support and funding).
- Publication ethics (no multiple publication of same results).
- Citation practice: no stealing of ideas or results, also not from own work. (data and concepts count, not wording!)
- Issues: all these points are obvious but have borderline cases when it comes to practical applications.
- The MPG and the DFG have issued guidelines for good scientific practice, many journals try to verify the authors relations to the work submitted and even request original data.

- The director is in general responsible for compliance with all German and International rules. (At AC, the group leaders represent the director!).
- We document all results of experiments that are used in publications together with the drafted publication in the AC database. (your obligation!).
- The data are owned by the MPG!, you own the authorship for the data.
- We document the history of publications in a FHI-wide workflow and provide as many results as possible open access as we are tax-payer financed. We never conduct secret (also against your colleagues) science!! (temporary occlusion for IP purposes are ok).
- We practice collaborative research: multiple author work is the rule, single author papers are the exception. We decide on the authors only after finishing work on a paper, the director has the final word.
- Significant neglect of these rules or publications without "workflow" are cause for immediate disciplinary consequences and dismissal from the FHI!

**fiffii** unicat

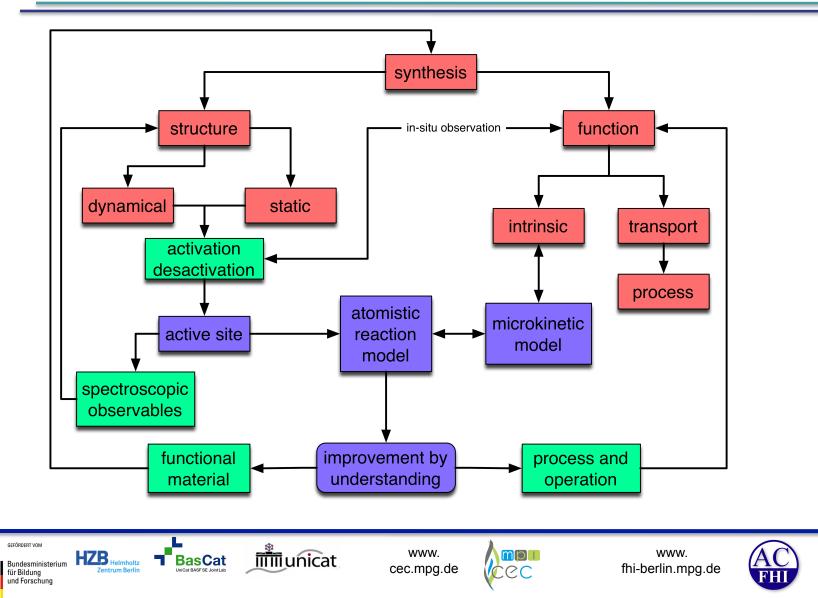

#### A perfect workplan for catalysis research (is this really possible?)

- Use critical literature studies ahead of experiments.
- Plan your experiments in families of well-chosen parameters; reproduction and error estimates.
- Analyse your results immediately when obtained : database entries (weekly!!!).
- Discuss your results frequently with your colleagues (plausibility!).
- Do never hide results also when unpleasant or unexpected ("cosmetics").
- Avoid extensive waste of experiment time due to misplaced parameters.
- Create a working hypothesis as soon as possible and discuss with supervisor.
- Document your research concept (introduction) and your working hypothesis.
- Always have a running presentation of your key results ready (monthly) and save previous versions for seeing the evolution of insight.

BasCat

- Synthesis is not preparation: understand what you do and pre-determine as many parameters as possible:
  - Titration of precipitation
  - IEP before adsorption
  - TG/MS before calcination
  - Never use Muffle furnaces (gas kinetics) even for drying!
- Synthesize sufficient sample and think about sample collection database
- Fill in sample database with as many details as possible, may be good for you when you need reproduction!
- Always analyze for elemental composition! Always analyze post-reaction.
- Use chemical probe reactions as much as possible (probe the interesting part of a catalyst).

www.

cec.mpg.de

• Verify in proven facts the absence of transport limitations!

**fiffii** unicat

• Never try to interpret data without consulting experts, become one!

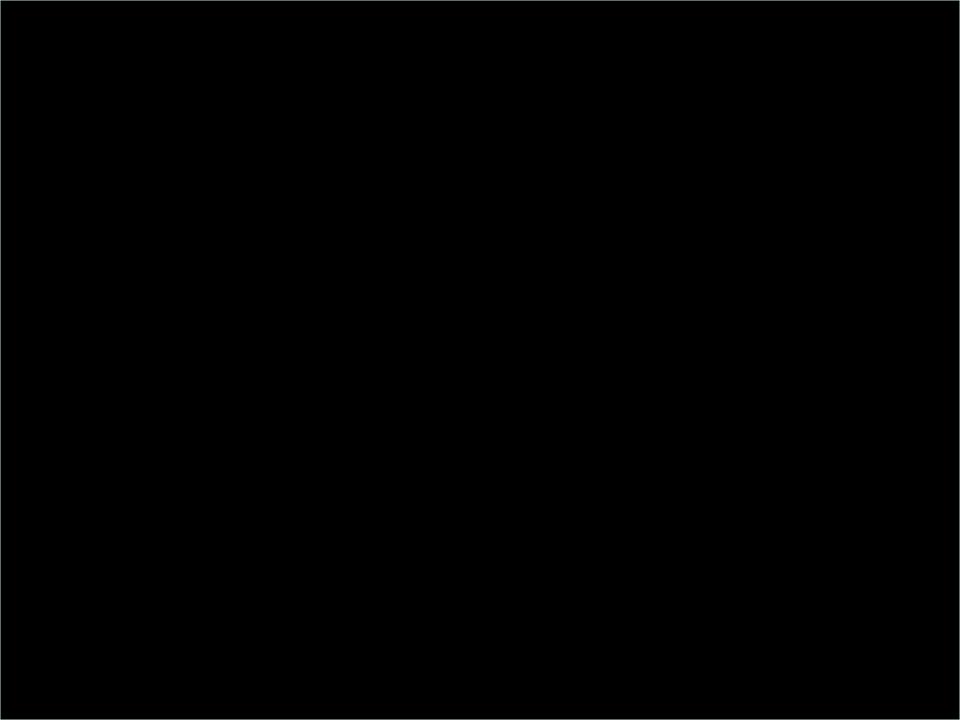

HZB

BasCat

- Intellectual challenge in physical chemistry.
- "Everything is interesting, only little is relevant" (John Thomas)
- Catalysis is over a century an enabling science and technology.
- It emerges from synthetic chemistry (catalysts and new molecules) and from physical chemistry (course of a chemical reaction, quantum theory).
- As an independent science still problematic:
- Concepts, models, gaps, "real systems"
- Is there a chance to arrive at a genuine understanding as basis for the challenges of catalysis enabling renewable energy systems?

## Heterogeneous Catalysis

Some introductory views beyond the textbook.....

www.fhi-berlin.mpg.de

- The central concept in all types of catalysis.
- Act as coordination centres allowing to exchange adsorbates (fragments) and electrons (oxidation state).
- Are modified during chemical bond rearrangement.
- In a catalytic cycle they are regenerated in to their most active initial state. How does this work? Deterministic against thermodynamics?
- Adaptivity required as mostly the reaction product is more reactive than the starting species: selectivity through autogenous partial deactivation.

für Bildung und Forschung

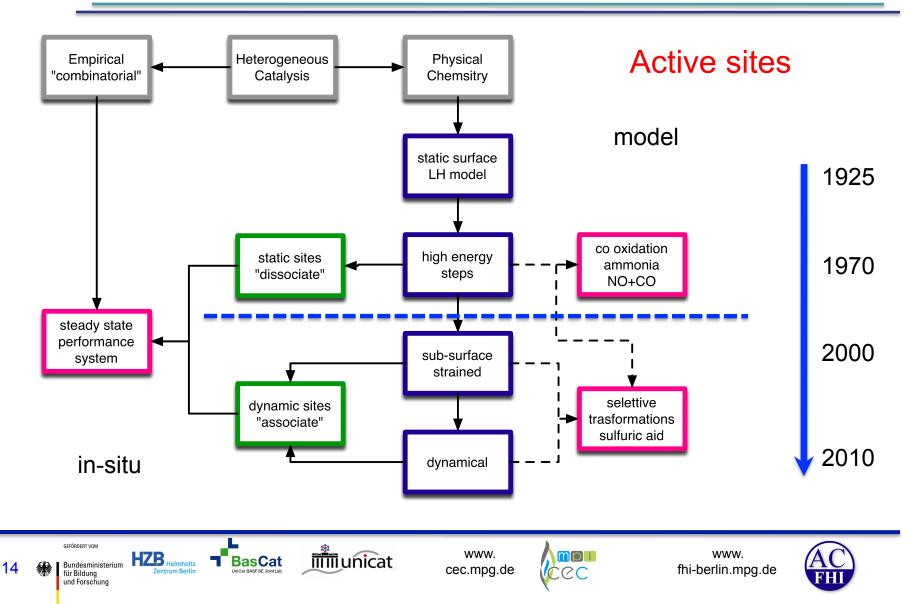

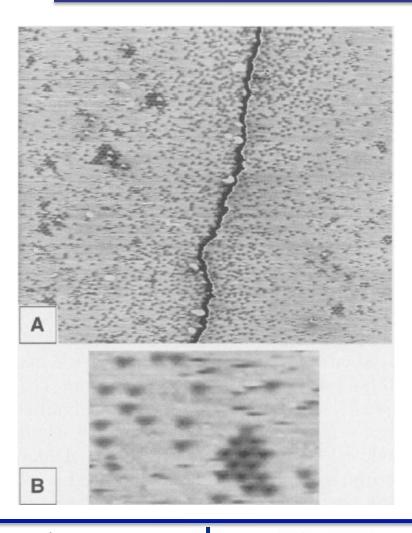

#### Heterogeneous catalysts: an evolutionary sucess story

Discover by STM that steps are the dissociating functions even on single crystal surfaces.

Evidence that "defects" are important for reactivity.

Was also found by Somorjai earlier indirectly during hydrocarbon conversions on Pt and Pd single crystals (selectivity control).

- Temporal evolution of a system on microscopic scales without external forcing.
- Occurs while system at larger scales is in steady state or equilibrium.
- Kinetics requires external forcing (min: transport).
- Dynamics in catalysis occurs on multiple scales.
- Term is used equivalent for reactions between the catalyst and reactants unintentional during catalytic transformation.

www.

cec.mpg.de

• Requires "activation" and is dependent on reaction conditions.

fhi-berlin.mpg.de

ABSTRACT: We report here the Raman spectrum and lattice dynamics study of a well-crystallized  $\beta$ -V<sub>2</sub>O<sub>5</sub> material prepared via a high-temperature/high-pressure (HT/HP) route, using  $\alpha$ -V<sub>2</sub>O<sub>5</sub> as the precursor. Periodic quantum-chemical density functional theory calculations show good agreement with the experimental results and allow one to assign the observed spectral features to specific vibrational modes in the  $\beta$ -V<sub>2</sub>O<sub>5</sub> polymorph. Key structure-spectrum relationships are extracted from comparative analysis of the vibrational states of the  $\beta$ -V<sub>2</sub>O<sub>5</sub> and  $\alpha$ -V2O5 structures, and spectral patterns specific to the basic units of the two V2O5 phases are proposed for the first time. Such results open the way for the use of Raman spectroscopy for the structural characterization of vanadium oxide-based host lattices of interest in the field of lithium batteries and help us to greatly understand the atomistic mechanism involved in the  $\alpha$ -to- $\beta$  phase transition of vanadium pentoxide.

#### Function of a catalyst: Static SM

Bulk is "irrelevant", no chemical transformations sub-surface

#### Many relevant reaction profiles are more complex

GEFÖRDERT VOM

für Bildung und Forschung 20

www. cec.mpg.de

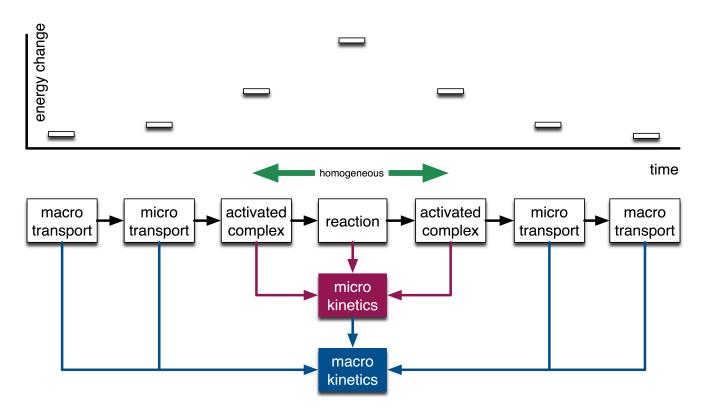

Catalysis - a multi-scale process:

how to conclude about active sites from observation?

Several steps have to occur that a catalytic process can operate

Chemistry scales to the dimension of 10<sup>23</sup>: Molecular insight is only part of the story

on the way from a challenge to a designer material

- Heterogeneous Catalysis cannot be described in general by concept of static catalysts (single crystals, models, predefined systems).
- The exceptions are systems in which activated adsorption is sufficient for the reaction: total hydrogenations and some oxidations.
- For selective reactions the concept of active sites needs a new element:
- Chemical dynamics

HZB

Bundesministerium

für Bildung und Forschund

• In this concept catalysts are not static but react with the reagents according to their chemical potential.

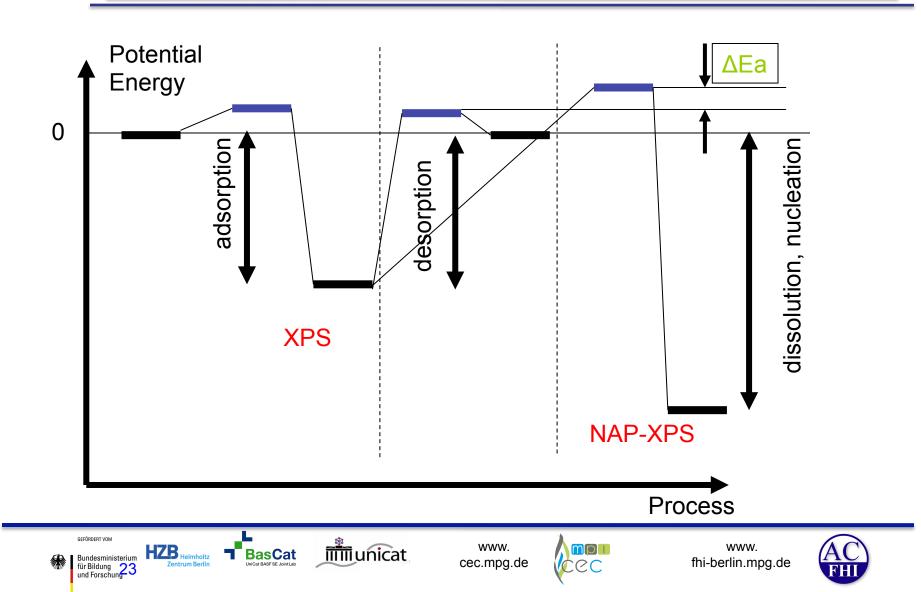

**ÎÎÎÎÎ**Î unicat

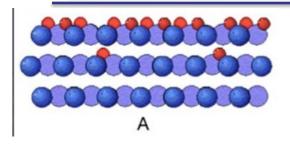

Chemical dynamics and energetics: one example is sub-surface reactivity

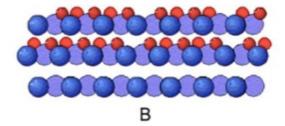

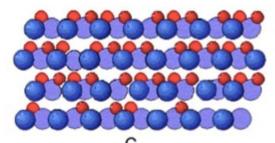

### Surface and sub-surface species

At low potential: metal plus dissolved species ("dirt")

At slightly elevated potential: "trilayer" (theory)

D

- One may expect to understand catalysts by studying the performance: arrive at the "structure-function relation"
- This is complex as we have no "active site spectroscopy"
- Catalyst quality according to yield per unit
  - Mass: well measurable
  - Total surface area: more realistic
  - Active surface area: sometimes possible

**fiffii** unicat

- Active site most desired: not countable (tof concept)
- No absolute measure possible for any catalyst today!!
- Similar ambiguities hold for the structure analysis: which is the active part that is relevant?

HZB

Chemical dynamics decouples oxidation of substrates and reduction of oxygen

 $Me_2O_2(OH)_4$ 

 $Me_{2}O(O^{-})_{2}(OH)_{4}$ 

A facile concept to exchange one electron pair: Challenge: the activation of di-oxygen requires 4 electrons: Larger site or stable intermediate involving two processes

**Î**ÎÎÎÎ unicat

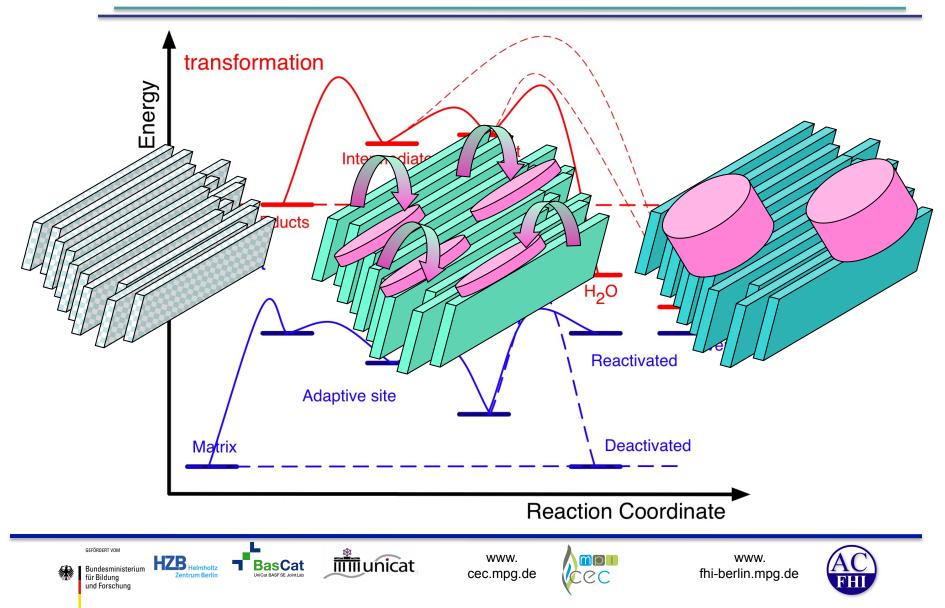

www. cec.mpg.de

#### Selective oxidation: Coupling of transformation and material

- Let us assume that the unifying concept between all sorts of catalysis is the notion of a dynamical active site.
- It forms only in situ and requires sufficient flexibility of the matrix material: nanostructuring and high temperatures, addition of water or other co-catalysts.
- In solids restructuring, sub-surface chemistry or segregation.
- The resulting active phase (complex) fluctuates always around a stable mean structure and brings about for short times configurations that react with stable substrate molecules: activation.
- In solids this may also be achieved for very stable educts by static step structures with suitable modifications when the resulting product does not block the static site. (otherwise adaptive site required with "ligand" exchange or change in local electronic structure).
- The catalyst regeneration is only on average a cyclic process and occurs through dynamics acting also on the deactivated site.
